

Creating and Optimizing Knowledge Panels for Businesses

A repeatable SOP for agencies, in-house teams, and freelancers to earn a business a trusted entity presence in Google's Knowledge Graph. Distilled from insights by Callie Scott of Blue Orchid Digital.

Objective

Guide the process of creating and optimizing knowledge panels for businesses so they establish a recognized entity in Google's Knowledge Graph and strengthen their online presence and credibility.

Key Steps

1. **Build an entity home page:** Create a dedicated authority page — ideally an about page on your own site or a social page you control.
2. **Optimize the page:** Include comprehensive information on what the business does and who it is, plus links to corroborating sources (LinkedIn, Crunchbase, social profiles).
3. **Link optimization:** Verify information consistency across corroborating sources and interlink them with the entity home page to build trust.
4. **Implement structured data:** Add schema markup on the about page; link all corroborating sources and keep descriptions consistent to teach Google about the entity.
5. **Practice patience and monitoring:** Expect 10–12 months for results; monitor progress and adjust to improve knowledge graph visibility.

Cautionary Notes

- Avoid ambiguous entity names that may hinder recognition in the knowledge graph.
- Be patient and persistent in following the steps to achieve desired results.
- Ensure information consistency and relevance across all platforms and sources.

Tips for Efficiency

- Use tools like the Kalicube knowledge graph explorer to identify related entities.
- Work within available resources and corporate guidelines to optimize for both search engines and users.
- Regularly monitor and adjust the optimization strategy based on results and feedback.
