

Turn Review Language Into Long-Tail Use-Case Pages

Objective

You finish with a short list of use-case pages, one layer deeper than your site goes today. Each targets a situation your customers named in their own words, is checked against keyword data, and carries its own evidence: the matching reviews, the data points and a case study. That covers both halves of Ross's argument. The long-tail page answers a search your current pages are too broad for, and the proof on it is the thing that lifts conversion and makes an LLM comfortable recommending you. In his words: "CRO is GEO."

"You could use review data, see what kind of descriptors people are using in your review data." - Ross Hudgens

Key Steps

1. **Pull every review you can reach into one file.** Google Business Profile, G2, Capterra, Trustpilot, Amazon, app stores, testimonial forms, NPS comments. Keep the review text, the platform, the date and the reviewer name. *(inferred)*
2. **Have an LLM extract the descriptors.** Paste the file in and ask for every situation, industry, team size, problem and "I used it for..." phrase customers use, with a count and two example reviews for each. "LLMs make it super easy to combine that with Ahrefs data, Semrush data, your tool of choice." *(inferred)*
3. **Join the descriptors to keyword data.** Run the top descriptors through Ahrefs, Semrush or whatever tool you already pay for, as "[category] for [descriptor]" and "[problem] + [descriptor]" permutations. Note volume and what the current results look like.
4. **Go one layer deeper than your current site.** Map each permutation to an existing page (expand it) or a new use-case page under the right parent. "What are the unique permutations that your business solves? Maybe you had two layers deep, but now maybe it's worth going three layers deep in just the complexity of what that user searches."
5. **Cut the list to real demand and real fit.** Keep permutations with search volume, or with a question a buyer would plainly put to ChatGPT, that your business actually serves well. Drop the rest. A page with no real answer behind it is a doorway page, and it will not convert anyone. *(inferred)*
6. **Build each page with the proof on it.** Put the reviews that use that descriptor, the data points and a case study for that use case near the top of the page. Ross asks three questions of home and product pages: "Do you have case studies there? Do you have the data points? Do you have your reviews front and center on your website to make it very obvious to LLMs, so they don't have to go find them?" Say plainly who the page is for. Ross's point about positioning applies here: a page that claims "best overall" is harder for anyone else to cite as best for a specific situation.
7. **Link the pages in and measure them as a group.** Link each new page from its parent category or solution page and from your navigation, then report the set together. Track AI referrals and direct landings on these URLs, not only rankings. Ross passed on a proxy from Eric Wu at Ramp: most direct visits to URLs other than the home page are probably bots, so carve them out in analytics as an AI proxy. *(inferred)*

Cautionary Notes

- Do not rewrite the descriptors into marketing language.
- Do not edit or invent review text.
- Do not expect review stars in the search results from your own reviews.
- Do not paste the same testimonial on every page.
- Do not skip step 5.
- This is a recommendation, not a measured result.

Tips for Efficiency

- Start with the platform where you have the most reviews.
- Put the same proof on your home page, about page and product pages.
- Ask sales and support which descriptors they hear on calls.
- Pair the use-case pages with versus pages.
- Re-run the extraction every quarter.
